

Active Directory Device Agent Guide

Device Migration Between Tenants

Consilium → Ramudden Global tenant

1. Overview

Quest On Demand Migration (ODM) for Active Directory includes a Device Agent that runs on each workstation being migrated between tenants. The agent walks the device through a scripted cutover sequence.

The result is that the user keeps their existing desktop, files, and local settings, and signs in once more with their new target-tenant account after the final reboot — without a full wipe or reset.

This guide documents what the Device Agent shows the user, what each step in the process does, and one important behaviour the support team should know before communicating this to end users (Section 4).

2. Before You Start

- The user should save and close all open work before starting — the process includes at least one automatic reboot.
- The user needs both their source (Old: windows login PIN or Password) and target (New: **firstname.lastname@consilium-ts.co.uk**) tenant credentials on hand — both are used during the process (see Section 4).
- The full sequence typically takes 15–30 minutes; most of it runs unattended in the background.

3. What the User Sees

1. Migration prompts starts. When the migration job is scheduled, the agent displays a prompt naming the workstation and the signed-in account and explains the process will take approximately 15–30 minutes. The user is asked to save their work, then click Start. Postpone and Cancel options are also available if the user isn't ready.

Figure 1 — Initial migration prompt shown to the user.

2. Task sequence runs. After Start is clicked, the agent works through a queue of tasks shown on screen (Queued → In Progress → Completed).
3. Mid-process reboot. Partway through — after the step BT-DisableUCPD — the agent shows a message that it has disabled the UserChoice Protection Driver to allow permission updates on protected registry keys, and that the device will now reboot.

Figure 2 — Mid-process message shown before the device reboots.

Sign-in after rebooting — with the OLD account (PIN or Password for Windows login). When the device comes back up, the user must sign back in using their SOURCE (old) tenant windows login, not the new target account. This is required for the remaining tasks to complete.

Important — Sign-In Behavior After the First Reboot

Known behavior: after the mid-process reboot, users must sign in with their **OLD** (Windows login PIN or password — **not** your new **firstname.lastname@consilium-ts.co.uk**)

This is easy to miss, since users may expect to use their new account right away. Flag it explicitly wherever this process is communicated to end users, so it isn't mistaken for a failure.

4. The remaining tasks are complete. The agent finishes re-permissioning the local profile (ReACLPrepareWin10Profiles), re-enables the UserChoice Protection Driver (EnableUCPD), and performs the Entra ID cutover (EntralDCutover).

Figure 3 — Remaining tasks completing (profile re-permissioning and Entra ID cutover).

5. Final reboot. Once all tasks show Completed, the workstation needs to reboot again. After this reboot, the device is Entra ID-joined to the target tenant, and the user signs in with their **NEW** target-tenant (**firstname.lastname@consilium-ts.co.uk**) account going forward.

Please make sure to manually reboot your device in this step and then wait for 5 minutes before signing in again.

4. Troubleshooting & FAQ

What if the user clicks Postpone or Cancel?

Postpone reschedules the prompt for later (the countdown shown on the prompt indicates how long the current request remains valid). Cancel stops the migration job from starting; confirm with the migration team whether the device needs to be rescheduled.

What if the device doesn't come back up after the reboot?

Please reach out to the Support Team for further help.

5. Support

For issues during a device migration, please reach out to the onsite support team.
